### EX PARTE OR LATE FILED

July 25, 1996

DOCKET FILE COFY ORIGINAL

RECEIVED
JUL 2 5 1996
FEDERAL COMMUNICATIONS COMMISSION
OFFICE OF SECRETARY

### **EX PARTE**

William F. Caton Acting Secretary Federal Communications Commission Mail Stop 1170 1919 M Street, N.W., Room 222 Washington, D.C. 20554

Dear Mr. Caton:

Re: CC Docket Nos. 96-45 and 96-98

Attached is a document containing algorithms for Pacific's Cost Proxy Model in response to a request by Anthony Bush and William Sharkey of the Common Carrier Bureau. In addition, we provide the following information: the fill factors in the cost Proxy Model include all services, both business and residential. Efficiencies in the residence loop are realized via the inclusion of all services. In wire centers where competition already exists fill factors are at lower levels. Please associate this material with the above referenced proceeding.

We are submitting two copies of this notice in accordance with Section 1.1206(a)(1) of the Commission's Rules.

Please stamp and return the provided copy to confirm your receipt. Please contact me should you have any questions or require additional information concerning this matter.

Sincerely,

cc: (w/ attachments)

Anthony Bush

Dean Grampuno

William Sharkey

# Cost Proxy Model Cost Engine Algorithms

## Cost Proxy Model ©

The CPMO is an efficient, SAS based system that develops the costs for local telecommunication services. This is accomplished through the use of user supplied cost and engineering tables and commercially available customer related data (census, daytime population, terrain, wire center boundaries, and wire center information).

The CPM is broken into three major modules: Cost Engine, Customer Engine, and the Reporting Engine. This document will cover the algorithms used in the Cost Engine. These algorithms develop unit costs (per foot, per message, etc.) that are then applied to the information contained in the Customer Engine (total feet, total messages) to arrive at the cost of Universal Service, Unbundled Links, Unbundled ports, etc., for a specific geographic section of a serving territory (Wire Center, Census Block Group, Company, etc..).

### Cost Engine Algorithms

The unit costs are developed using user supplied cost/engineering data along with CPM unit cost algorithms.

### CPM Engineering/Cost Tables:

- A + B Cost file (AB\_CST.CSV) Capitalized cost of outside plant equipment.
- Outside Plt Adj (Plant Adjustment) file (OSP\_FCT.CSV) Provides an adjustment to the capitalized value of cable plant based on the density value and terrain type.
- Cable Size file (CBL\_SIZ.CSV) Given certain density zones, this table provides the average outside plant cable size used.
- Other Inv (Investment) file (OTH\_INV.CSV) This is a file that contains those investment items driven only by lines (for example, terminal, drop, SAI).
- Fill Level file (FILLS.CSV) Provides the going forward actual plant utilization rates
- Switch / 10 (Interoffice) file (SIO\_INV.CSV) Switch and Interoffice investment by line, message, etc.

### CPM Engineering/Cost Algorithms

Notation in algorithms is as follows:

(CPM CSV File name). (CSV file Variable) (CPM lookup variables) ) where.

CPM CSV file name is based upon the first extent from the above listed data tables.
